# Nuclear Structure of Neutron-Rich Cadmium Around the $N = 82$ Shell Closure

Dr Nikita Bernier, University of the Western Cape

Seminarium fizyki jądra atomowego, Uniwersytet Warszawski

10 października 2024 r.

What are atoms made of?

How were the elements made?

What are atoms made of?

- 1949: Shell model of nuclear structure

How were the elements made?

- 1939-1948: Big Bang and Stellar nucleosynthesis
- 1957: Heavy element nucleosynthesis

Today: study of exotic radioactive nuclei at accelerator facilities!

- Increased binding energy at particular proton ( $Z$ ) and neutron ( $N$ ) numbers

- Full shell (closures) occur at **magic numbers**
- Closed proton shell and closed neutron shell in **doubly-magic** nucleus

- Nucleon-nucleon interaction and mean-field potential

$$\begin{aligned}
 H &= \left[ \sum_{i=1}^A \frac{p_i^2}{2m} + \sum_i v(\vec{r}_i) \right] + \left[ \sum_{i \neq k}^A V(\vec{r}_{i,k}) - \sum_i v(\vec{r}_i) \right] \\
 &= H^0 + W_{RES}
 \end{aligned}$$

- Nucleon-nucleon interaction and mean-field potential

$$H = \left[ \sum_{i=1}^A \frac{p_i^2}{2m} + \sum_i v(\vec{r}_i) \right] + \left[ \sum_{i \neq k}^A V(\vec{r}_{i,k}) - \sum_i v(\vec{r}_i) \right]$$

$$= H^0 + W_{RES}$$

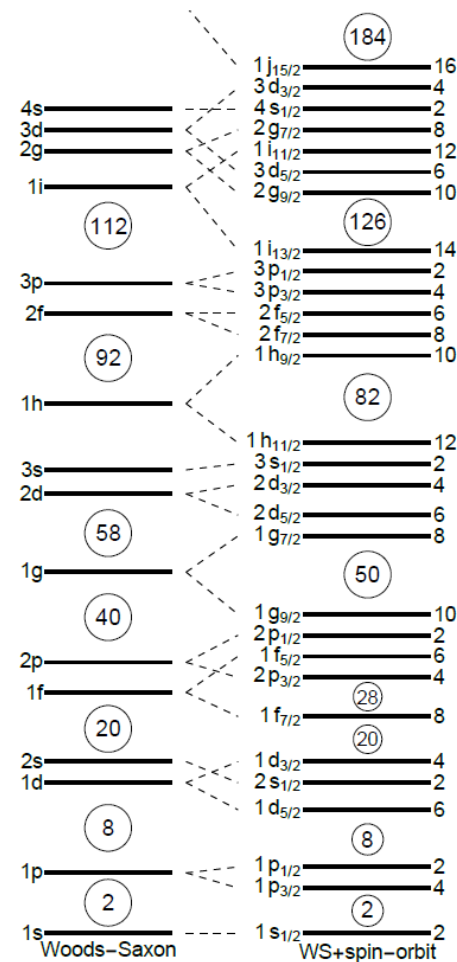

- $W_{RES} = 0$ : Non-interacting shell model

$$H^0 = \sum_{i=1}^A \frac{p_i^2}{2m} + \sum_i v(\vec{r}_i)$$

- Choice of potential gives single-particle energy levels

$$V(r_i) = \frac{-V_0}{1 + \exp[(r_i - R)/a]} + V_{so}(r_i) \vec{l} \cdot \vec{s}$$

- Some ground state properties ( $J^\pi$ ) are reproduced

- Nucleon-nucleon interaction and mean-field potential

$$H = \left[ \sum_{i=1}^A \frac{p_i^2}{2m} + \sum_i v(\vec{r}_i) \right] + \left[ \sum_{i \neq k}^A V(\vec{r}_{i,k}) - \sum_i v(\vec{r}_i) \right]$$

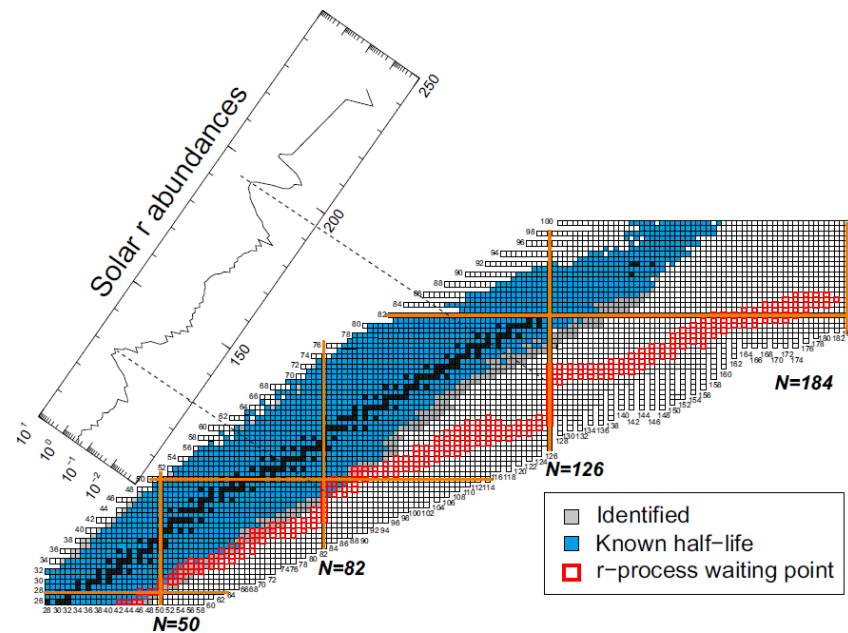

$$= H^0 + W_{RES}$$

- $W_{RES} \neq 0$ : Interacting shell model
  - Configuration mixing
  - Effective two-body (NN) matrix elements
- Recent developments:
  - Chiral effective field theory (3N)
  - Ab initio methods (many-body)

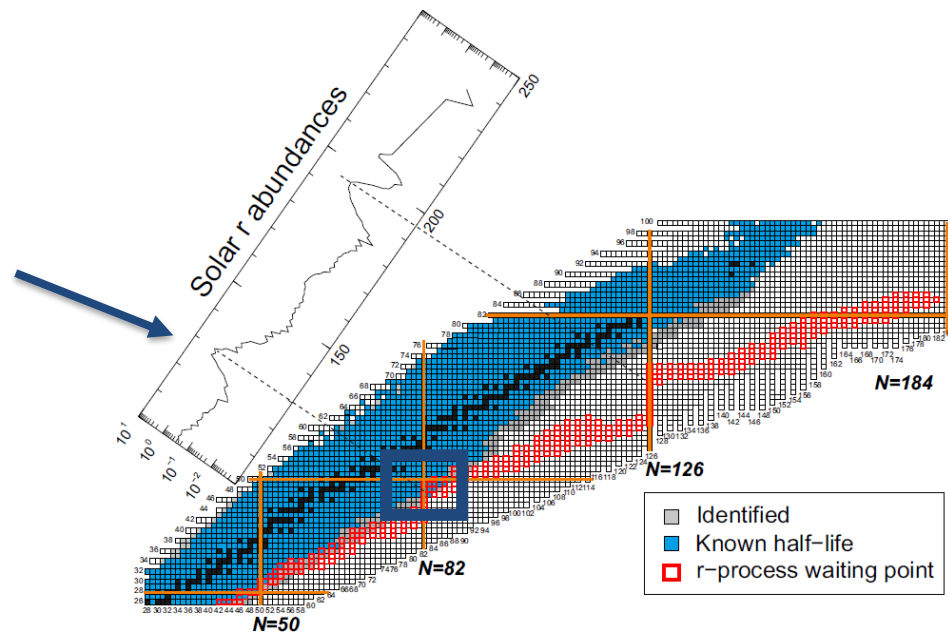

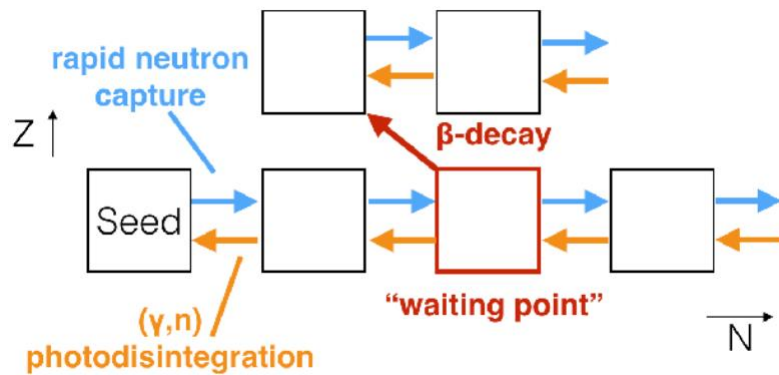

Valence space

- pp-cycle and CNO-cycle up to  $^{16}\text{O}$ , advanced burning up to  $^{56}\text{Fe}$
- Rapid neutron capture (**r**-) **process** path formed by **waiting point** nuclei, which create half of the nuclei heavier than  $^{56}\text{Fe}$

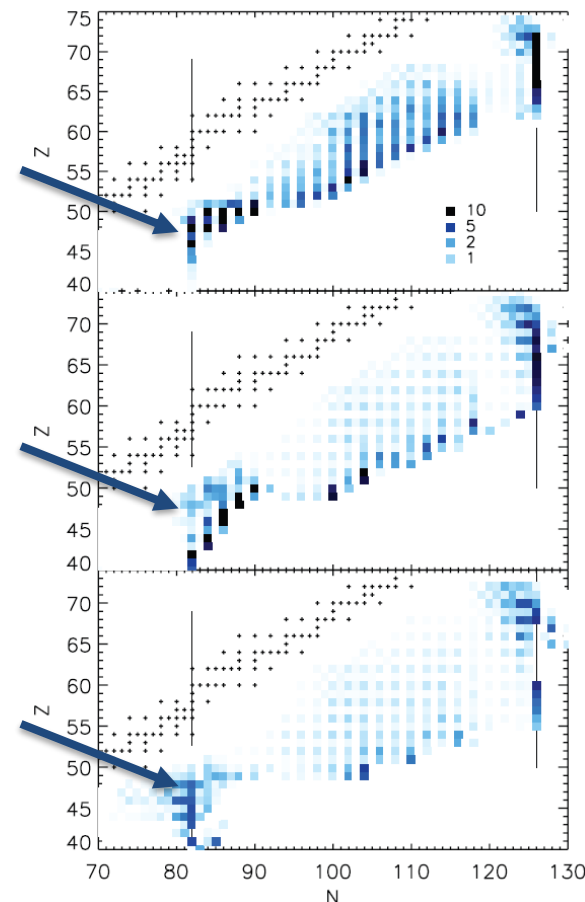

- pp-cycle and CNO-cycle up to  $^{16}\text{O}$ , advanced burning up to  $^{56}\text{Fe}$
- Rapid neutron capture (**r**-) **process** path formed by **waiting point** nuclei, which create half of the nuclei heavier than  $^{56}\text{Fe}$
- $N = 82$  isotope  $^{130}\text{Cd}$  provides critical information on the **abundance peak** at  $A \sim 130$ .

- Hot and cold *r*-process winds from supernova explosion and neutron star merger

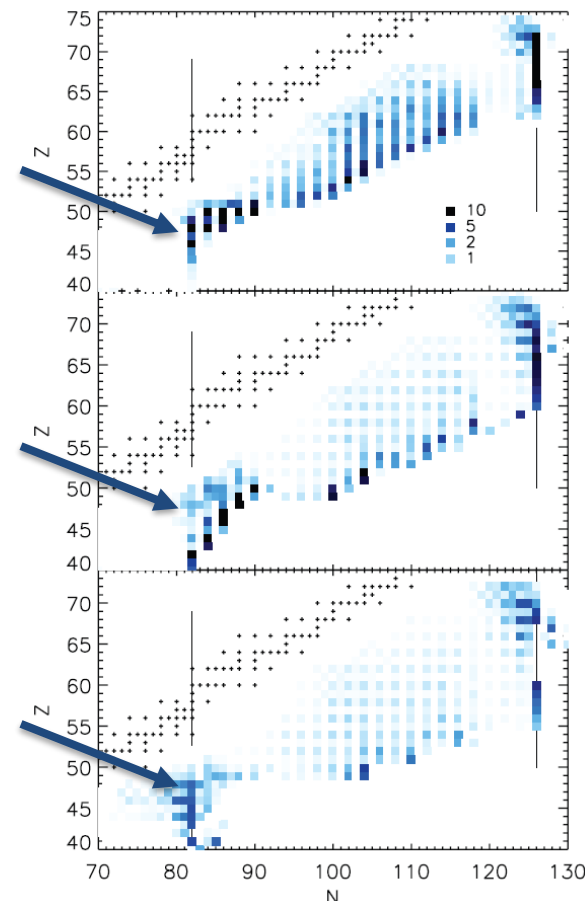

$$\frac{n(A+1, Z)}{n(A, Z)} = n_n \cdot \sqrt[3]{\frac{A+1}{A} \cdot \frac{2\pi\hbar^2}{k_B T \cdot m_u}} \cdot \exp\left(-\frac{S_n}{k_B T}\right)$$

- Hot and cold *r*-process winds from supernova explosion and neutron star merger

$$\frac{n(A+1, Z)}{n(A, Z)} = n_n \cdot \sqrt[3]{\frac{A+1}{A} \cdot \frac{2\pi\hbar^2}{k_B T \cdot m_u}} \cdot \exp\left(-\frac{S_n}{k_B T}\right)$$

- Defining nuclear physics parameters
  - Masses,  $S_n$ ,  $Q_\beta$
  - $\beta$ -decay lifetimes
  - $\beta$ -delayed neutron emission probabilities rates
  - Shell structure far off stability

- $^{128-132}\text{Cd}$  are neighboring the **doubly-magic**  $^{132}\text{Sn}$ , which is central to shell model calculations and  $r$ -process simulations

	78	79	80	81	82	83	84	85	N

- 1988 experiment at OSIRIS in Sweden: 7 transitions and 4 levels (1 isomer)
- Re-evaluated in 2015.

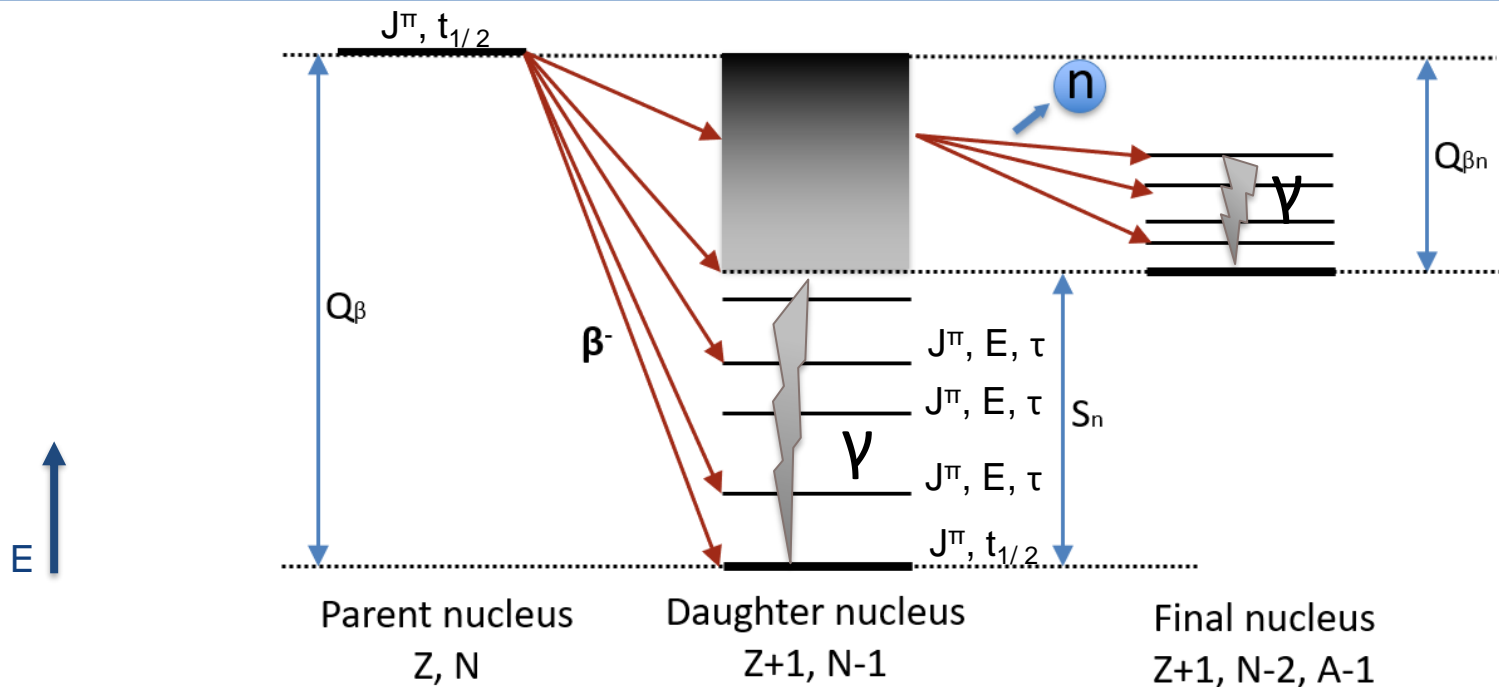

Work by B. Ekstrom quoted in  
 B. Fogelberg, Nucl. Data for Sc. and Tech., **337** (1988)

Z. Elekes and J. Timar, Nucl. Data Sheets **129**, 191 (2015)

## Selection rules of $\beta$ -decay

Transition Type	$L$	$\Delta\Pi$	Fermi		Gamow-Teller	$\log(ft)$
			$\Delta I$	$\Delta I$	$\Delta I$	
Allowed	0	No	0	(0),1		$\sim 4.0-7.5$
First Forbidden	1	Yes	(0),1	0,1,2		$\sim 6.0-9.0$
Second Forbidden	2	No	(1),2	2,3		$\sim 10-13$

### Selection rules of $\beta$ -decay

Transition Type	$L$	$\Delta\Pi$	Fermi		Gamow-Teller	$\log(ft)$
			$\Delta I$	$\Delta I$	$\Delta I$	
Allowed	0	No	0	(0),1		$\sim 4.0-7.5$
First Forbidden	1	Yes	(0),1	0,1,2		$\sim 6.0-9.0$
Second Forbidden	2	No	(1),2	2,3		$\sim 10-13$

### Selection rules of $\gamma$ -decay

$$|J_i - J_f| \leq L \leq J_i + J_f$$

$$\Pi(EL) = (-1)^L$$

$$\Pi(ML) = (-1)^{(L+1)}$$

- Selective ionization with the Ion Guide Laser Ion Source [IG-LIS]
  - Background suppression by factors  $10^5$ - $10^6$

- Selective ionization with the **Ion Guide Laser Ion Source [IG-LIS]**
  - Background suppression by factors  $10^5$ - $10^6$
- High statistics  $\beta$ - $\gamma$ - $\gamma$  with **SCEPTAR** : SCintillating Electron Positron Tagging Array

*In-vacuum moving tape collector system*

- Selective ionization with the **Ion Guide Laser Ion Source [IG-LIS]**
  - Background suppression by factors  **$10^5$ - $10^6$**
- High statistics  $\beta$ - $\gamma$ - $\gamma$  with **SCEPTAR** : SCintillating Electron Positron Tagging Array
- 16 large-volume germanium **GRIFFIN** detectors dedicated to **decay spectroscopy** of the low-energy radioactive ion beams at TRIUMF.

Yields	
$^{128}\text{Cd}$ :	1067 pps
$^{129}\text{Cd}$ :	122 pps
$^{130}\text{Cd}$ :	16-29 pps
$^{131}\text{Cd}$ :	~0.7 pps
$^{132}\text{Cd}$ :	~0.15 pps

*In-vacuum moving tape collector system*

- Discrimination of **isobaric background** by comparing  $\beta$ -gated  $\gamma$ -singles laser **on** (Cd + In) and laser **blocked** (mostly In)

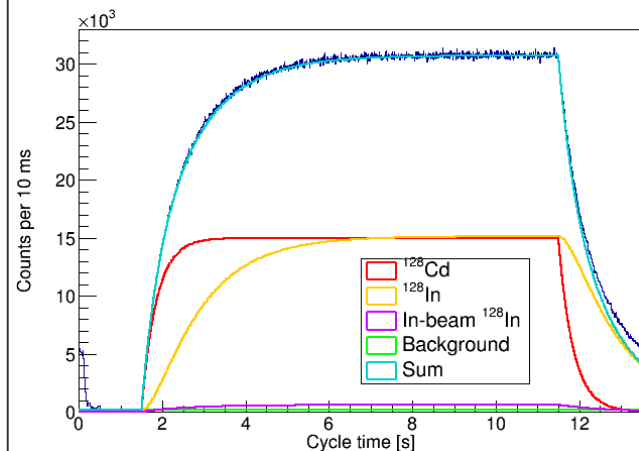

\* **Known**  $^{128}\text{Cd} \rightarrow ^{128}\text{In}$

\* **New**  $^{128}\text{Cd} \rightarrow ^{128}\text{In}$

- Discrimination of **decaying daughters** by comparing beam **on** data (Cd + In) and beam **off** data (mostly In)

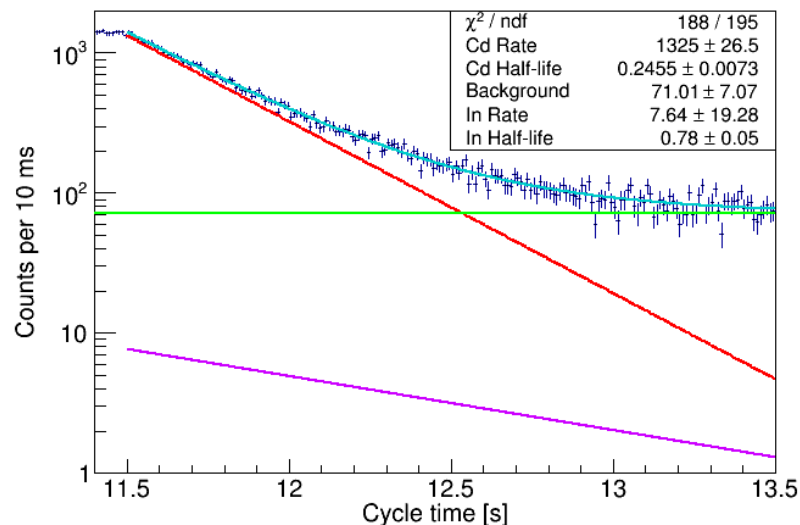

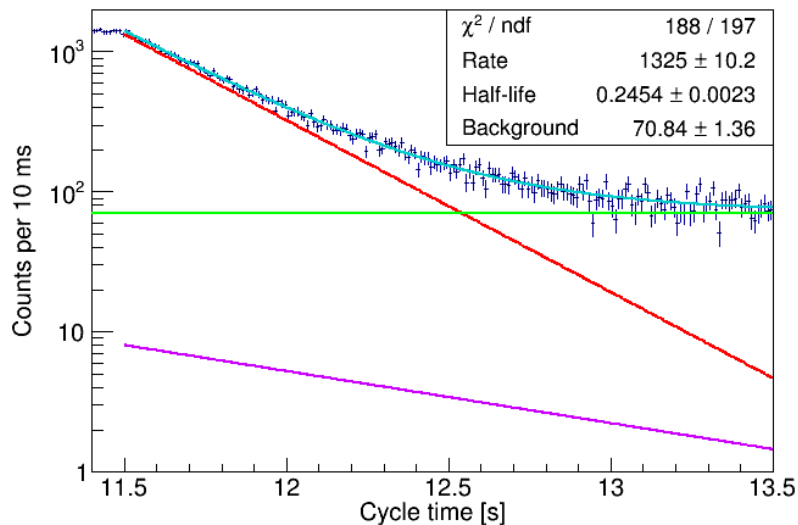

$^{128}\text{Cd } t_{1/2} = 245 \text{ (5) ms}$   
 $^{128}\text{In } t_{1/2} = 810 \text{ (30) ms}$

- Sum of 857 and 925-keV transitions
- Agrees with 245(5) ms (G. Lurosso *et al.*, PRL, 2015)  
and 246.2(21) ms (R. Dunlop *et al.*, PRCr, 2016)

$$A_{total}(t) = Ae^{-\ln 2 \cdot t / t_{1/2, parent}} + Be^{-\ln 2 \cdot t / t_{1/2, daughter}} + C$$

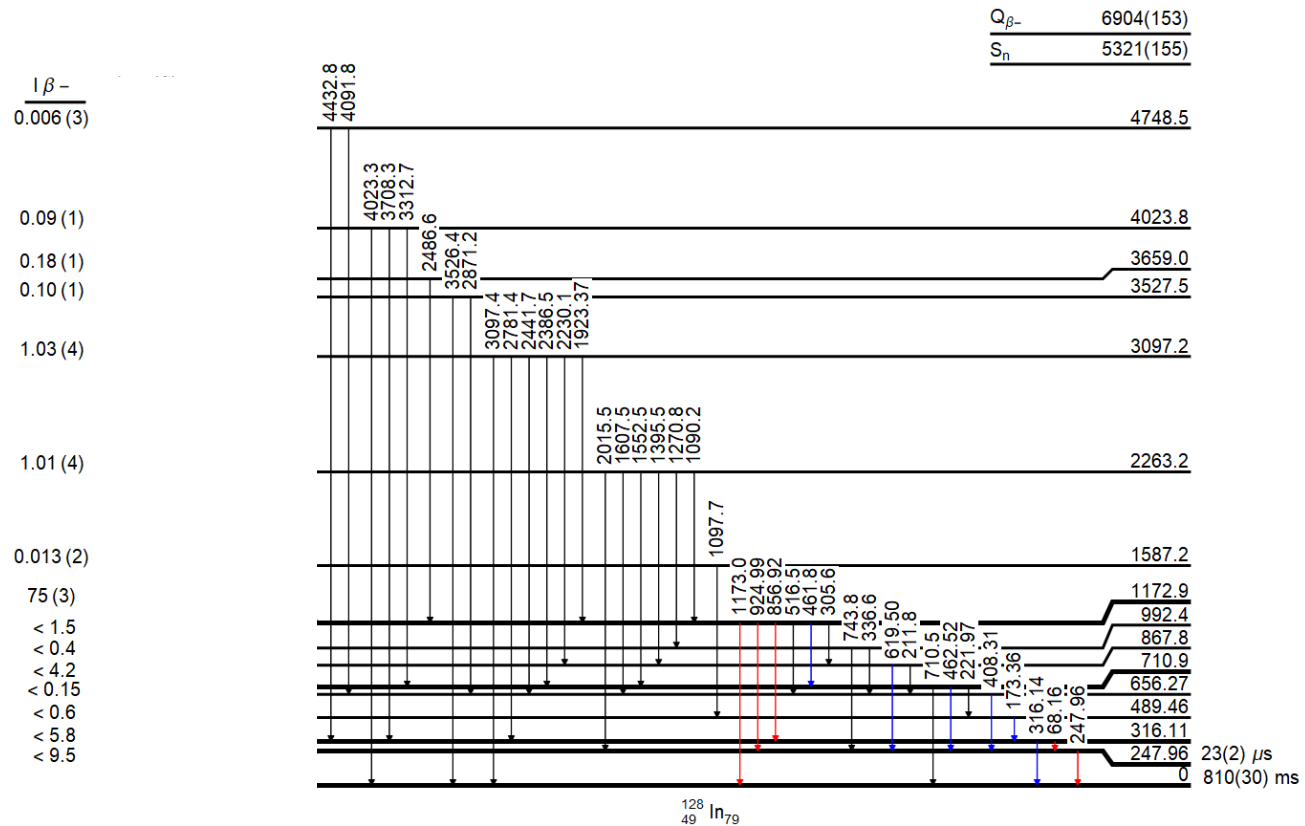

- 32 new transitions and 11 new states

- 32 new transitions and 11 new states

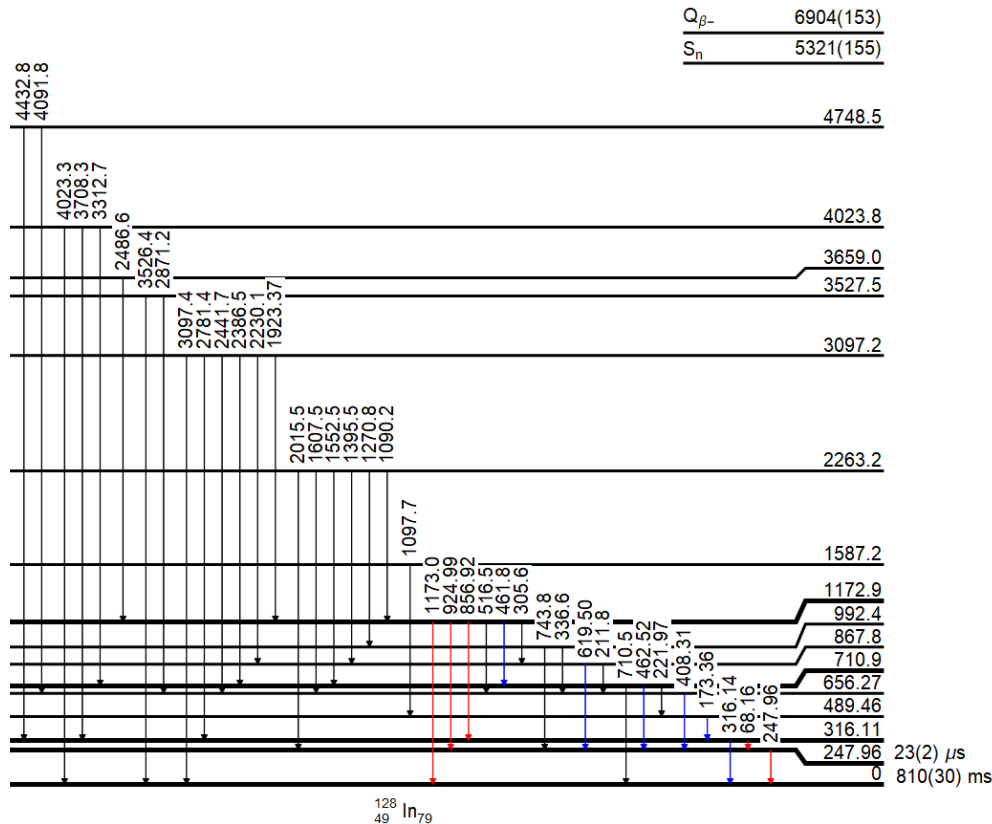

$$ft = \frac{f(Q_\beta - E_f, Z)T_{1/2}}{I_\beta(E_f)}$$

$$= \frac{k}{g_V^2 B(F) + g_A^2 B(GT)}$$

$$B(F) = |\langle \psi_f^* | \tau | \psi_i \rangle|^2$$

$$B(GT) = |\langle \psi_f^* | \sigma \tau | \psi_i \rangle|^2$$

$I_\beta -$	$\text{Log}(ft)$
0.006(3)	6.3(3)
0.09(1)	5.7(1)
0.18(1)	5.61(9)
0.10(1)	5.9(1)
1.03(4)	5.15(8)
1.01(4)	5.53(7)
0.013(2)	7.68(9)
75(3)	4.06(6)
< 1.5	> 5.88
< 0.4	> 6.56
< 4.2	> 6.4
< 0.15	> 7.6
< 0.6	> 6.56
< 5.8	> 6.2
< 9.5	> 5.8

- 32 **new** transitions and 11 **new** states
- Structure information from **log(ft)** values and angular correlations

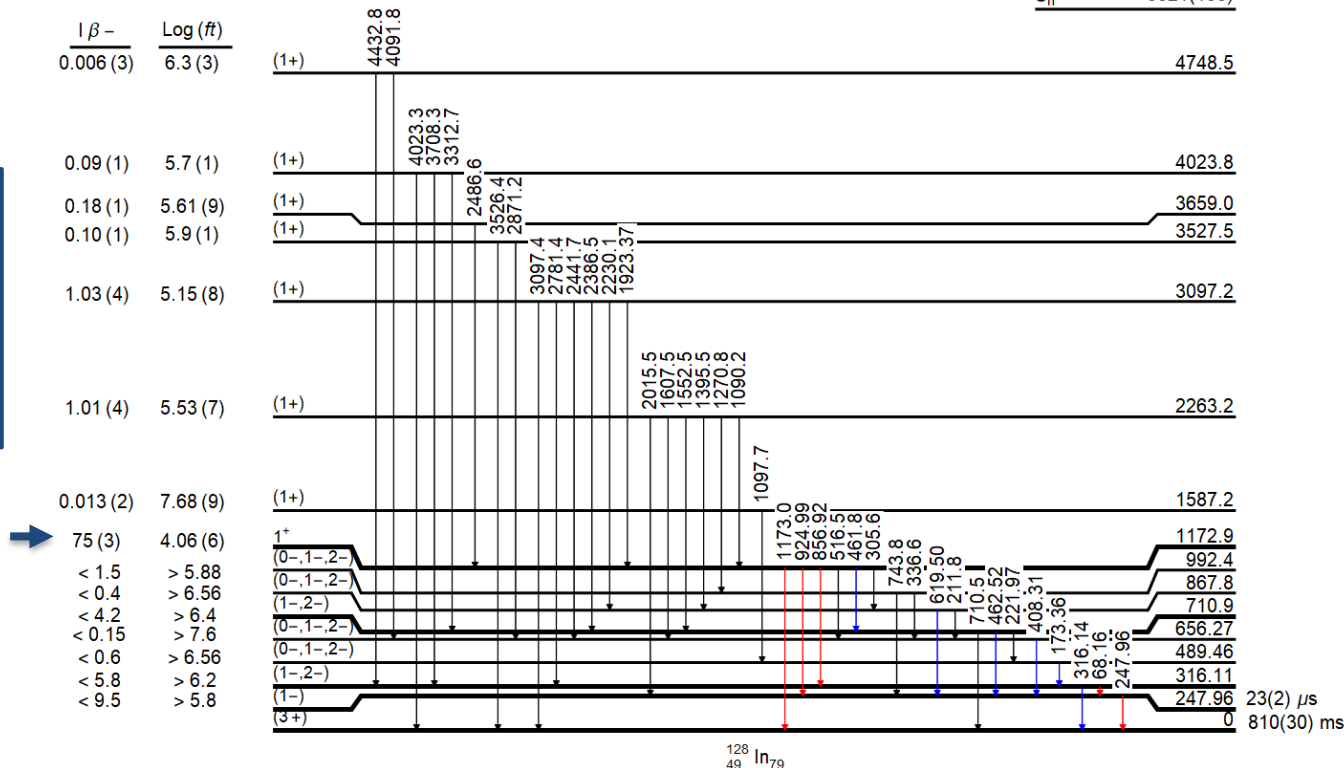

$Q_{\beta^-}$	6904(153)
$S_n$	5321(155)

$$ft = \frac{f(Q_{\beta} - E_f, Z)T_{1/2}}{I_{\beta}(E_f)}$$

$$= \frac{k}{g_V^2 B(F) + g_A^2 B(GT)}$$

$$B(F) = |\langle \psi_f^* | \tau | \psi_i \rangle|^2$$

$$B(GT) = |\langle \psi_f^* | \sigma \tau | \psi_i \rangle|^2$$

For two  $\gamma$ 's in coincidence:

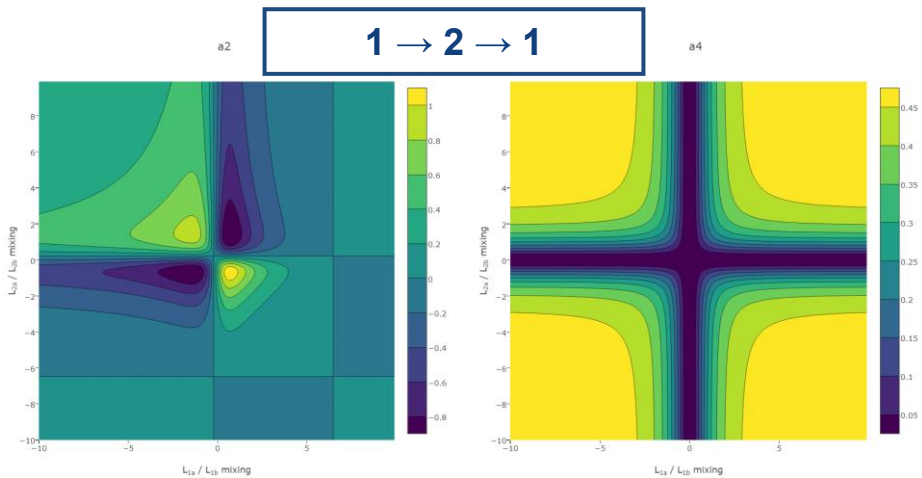

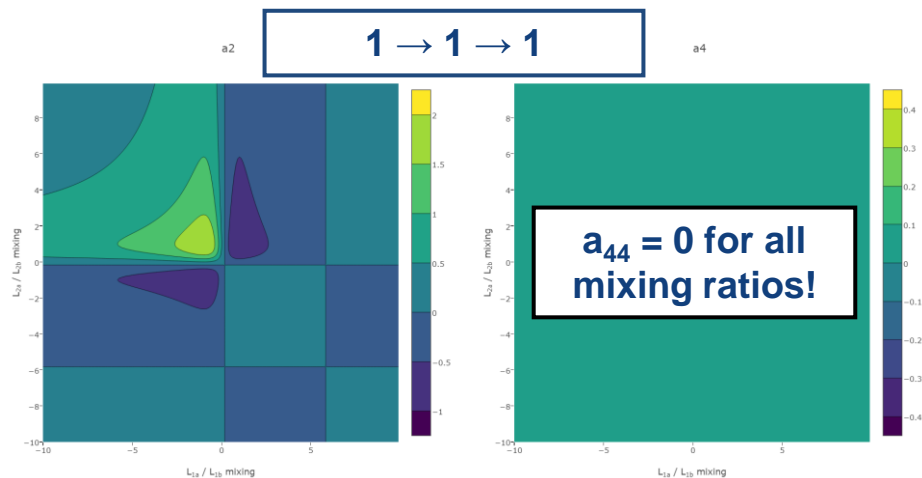

- Uneven population of  $m$ -substates with respect to the axis of the other  $\gamma$
- Information on transition **characters** and **mixing ratios** can be extracted by measuring the angular distribution of both  $\gamma$ 's as a function of the **angle between the detectors** which detected them:

$$W(\theta) = A_0[1 + a_{22}P_2(\cos \theta) + a_{44}P_4(\cos \theta)]$$

- Two mixing ratios mean many  $a_{22}/a_{44}$  possibilities
- Solution: Fix one mixing ratio at a time and hope that possibilities do not overlap for different spins
- Here: The cascades could be distinguished for  $-0.92 > a_{22} > 0.82$  and for  $a_{44} \neq 0$ .

- $jj45pna$  interaction:  $jj$ -coupling,  $4\pi$ - $5\nu$  orbitals, proton-neutron coupling

B.A. Brown and W.D.M. Rae, Nucl. Data Sheets 120, 115 (2014).

- Ab initio valence-space formulation of In-Medium Similarity Renormalization Group (VS-IMSRG)

S.R. Stroberg et al., Annu. Rev. Nucl. Part. Sci. 69, 307 (2019).

$$\pi g_{9/2}^{-1} \otimes \nu h_{11/2}^{-1}$$

$$\pi g_{9/2}^{-1} \otimes \nu d_{3/2}^{-1}$$

- 7 transitions observed in  $^{131}\text{In}$  at ISOLDE, **23** at RIKEN: only **4** transitions in common

O. Arndt *et al.*, Acta Phys. Pol. B **40**, 437 (2009)

C. Jost, PhD thesis, U of Mainz (2010)

J. Taprogge *et al.*, Eur. Phys. J. A **52**, 347 (2016)

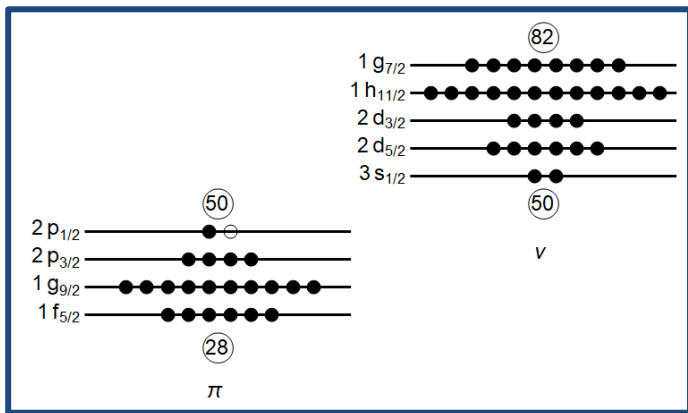

- Delivered at 0.7 pps
- Many transitions confirmed:  
**5/7** (O. Arndt *et al.*, Acta Phys. Pol. B, 2009)  
**21/23** (J. Taprogge *et al.*, Eur. Phys. J, 2016)
- One state in  $^{130}\text{In}$  strongly populated by  $\beta$ n-decay

- Only one coincidence relationship observed
- 4 transitions placed based on energy differences

- 1 proton away from double shell closure
- Only single-particle excited states can be calculated

Valence space

$$\pi 2p_{3/2}^{-1} \rightarrow (3/2^-) \quad 1353$$

$$\pi 2p_{1/2}^{-1} \rightarrow (1/2^-) \quad 365$$

$$\pi 1g_{9/2}^{-1} \rightarrow (9/2^+) \quad 0$$

 Experimental  $^{131}_{49}\text{In}_{82}$ 

jj45pna

IMSRG (-)

IMSRG (+)

- Very low neutron separation energy  $\rightarrow$  large neutron branching ratio

$$\begin{aligned}
 {}^{132}\text{Cd } Q(\beta^-) &= 12150 (510) \text{ keV} \\
 {}^{132}\text{In } S_n &= 2450 (60) \text{ keV}
 \end{aligned}$$

- 988 keV** transition expected in both  ${}^{131-132}\text{Cd}$  datasets

## Decay Spectroscopy of Neutron-Rich Cadmium Around the $N = 82$ Shell Closure

- **$^{128}\text{In}$ :** **32** new transitions and **11** new levels up to  $\sim 600$  keV from  $S_n$
- **$^{131}\text{In}$ :** **8** transitions placed and **8** levels up to  $\sim 1500$  keV from  $S_n$
- **$^{132}\text{Cd}$ :** Higher yields and cleaner beams recently obtained with IDS at ISOLDE!
  
- Would not be possible without the discriminating power of **IG-LIS**
- Important inputs for theoretical models of the  $r$ -process and the nuclear structure of exotic isotopes
- Understanding of nuclear forces and shell evolution in a region which only recently became accessible for more extensive studies!

Canada's national laboratory  
for particle and nuclear physics  
and accelerator-based science

Laboratoire national canadien de  
physique des particules, de physique  
nucléaire et de science fondée sur  
les accélérateurs

a place of mind
